Oracle Database Performance Tuning: Complete Overview

Subtitle: Methods, Utilities, and Industry Best Practices for High-Performance Databases

---

Trainingcred

Empower, Innovate, Advance.

Session Outline

Topics Covered in This Presentation

Overview of Performance Tuning

- Importance of database performance
- Key elements influencing performance

Performance Planning Basics

- Proactive versus reactive tuning
- Oracle’s recommended tuning framework

Instance-Level Tuning

- Memory, I/O, and operating system considerations
- Monitoring techniques and bottleneck detection

SQL Optimization Fundamentals

- Query tuning and execution plan analysis
- OLTP compared to DSS workloads

Oracle Performance Toolset

- Automated tools (AWR, ADDM, Advisors)
- Monitoring and diagnostic features

Performance Tuning Overview

What Is Database Performance Tuning?

A disciplined approach to improving database efficiency

Enhancing throughput while reducing response times

Ensuring optimal usage of CPU, memory, and I/O resources

Why Performance Tuning Is Essential

User Satisfaction: Poor performance frustrates users

Cost Control: Inefficient systems waste hardware resources

Scalability: Databases must support business growth

Stability: Performance issues often expose deeper problems

Three Core Areas of Database Tuning

Performance Planning – Architecture and design decisions

Instance Tuning – Optimizing database processes and memory

SQL Tuning – Improving application queries

Performance Tuning Lifecycle

When and How Tuning Is Performed

Proactive Tuning

- Ongoing monitoring and capacity planning
- Preventative maintenance

Reactive Tuning

- Troubleshooting active performance issues
- Eliminating identified bottlenecks

Oracle Performance Tuning Workflow

```
1. Define Baseline → 2. Monitor → 3.
Detect Symptoms
        ↓                    ↓
↓
4. Find Root Cause → 5. Apply Fix →
6. Confirm Results
```

Empower, Innovate, Achieve.

Key Oracle Documentation

Oracle Database *2 Day + Performance Tuning Guide* – Quick reference

Oracle SQL Tuning Guide – In-depth SQL optimization

Oracle Database Administrator's Guide – Operational best practices

---

Performance Planning

Laying the Groundwork for Performance

Begin with the Basics

Review performance fundamentals before system deployment

Preventive design is more effective than post-issue fixes

Oracle Performance Planning Covers

Cost and Investment Analysis

- Evaluating performance gains versus cost

Scalability Strategy

- Vertical vs. horizontal scaling
- Planning for future demand

Trainingcred
Empower, Innovate, Advance.

System Architecture

- Storage design and data partitioning
- Network and infrastructure layout

Application Design Best Practices

- Efficient access paths
- Appropriate database feature usage

Performance Planning (Continued)

Testing, Deployment, and Validation

Workload Modeling and Testing

Load testing to simulate real workloads

Stress testing to identify system limits

Predictive modeling for different usage scenarios

Deployment Best Practices

Gradual rollouts to reduce risk

Performance acceptance testing against SLAs

Strict change documentation

Common Planning Mistakes

Underestimating data growth

Ignoring concurrent user load

Neglecting backup and recovery performance

Trainingcred
Empower, Innovate, Advance.

Instance Tuning Basics

Optimizing the Database Instance

Definition

Instance tuning focuses on optimizing active Oracle processes and memory components

Primary Tuning Areas

Memory Management

- SGA sizing
- PGA configuration
- Buffer cache tuning

I/O Optimization

- Disk striping and layout
- Tablespace and datafile placement
- Redo and archive log tuning

Operating System Configuration

- Kernel and process parameters
- File system selection and tuning

Instance Tuning Lifecycle

From Design to Ongoing Monitoring

Initial Configuration Phase

Prevent bottlenecks through proper sizing

Apply Oracle-recommended defaults

Plan capacity accurately

Continuous Monitoring Model

```
Ongoing:   Collect Metrics → Analyze
→ Tune
             ↑                      ↓
Periodic:  Health Checks ← Validate ←
Implement
```

Trainingcred
Empower, Innovate, Advance.

Key Monitoring Dimensions

Memory utilization and waits

Disk I/O latency and throughput

CPU usage and queue lengths

Locking and concurrency waits

Performance Tuning Principles

Adopting the Right Mindset

Configuration Is Not Tuning

Configuration ensures functionality

Tuning optimizes behavior for real workloads

Tuning Characteristics

Driven by observed metrics

Focused on removing constraints

Iterative and continuous

Bottleneck-Focused Strategy

Find the dominant bottleneck

Fix it with targeted changes

Measure and repeat

When Tuning Occurs

During development

In testing environments

In production under pressure

As part of routine maintenance

Trainingcred
Empower, Innovate, Advance.

Performance Baselines

The Cornerstone of Effective Tuning

Why Baselines Matter

Define what “normal” performance looks like

Enable trend and capacity analysis

Measure the impact of changes

Support future planning

Baseline Metrics to Capture

```
Application:      Transactions,
response times
Database:         Wait events, cache
efficiency, SQL stats
Operating System: CPU, memory, disk,
network
Storage:          Latency, IOPS,
throughput
Network:          Bandwidth use,
packet errors
```

Trainingcred
Empower, Innovate, Advance.

Automatic Workload Repository (AWR)

Oracle's Native Performance History Tool

What Is AWR?

Automatically collects performance data

Snapshots taken periodically (default: hourly)

Historical data retention (default: 8 days)

AWR Components

Snapshots – Point-in-time statistics

Baselines – Snapshot ranges for comparison

Reports – Detailed workload analysis

Creating an AWR Baseline

Trainingcred
Empower, Innovate, Advance.

```
BEGIN

DBMS_WORKLOAD_REPOSITORY.CREATE_BASEL
INE(
    start_snap_id => 1000,
    end_snap_id   => 1010,
    baseline_name =>
'PEAK_HOURS_BASELINE'
  );
END;
```

Best Practices

Capture baselines during business peaks

Maintain separate baselines per workload

Preserve baselines before major changes

Trainingcred

Empower, Innovate, Advance.

Symptoms vs. Root Causes

Avoiding Misdiagnosis

Key Rule: Symptoms reveal issues but are not the true problem

Examples

Slow disk reads may indicate bad SQL, not slow disks

High CPU usage often points to inefficient queries

Latch contention usually reflects design flaws

Correct Approach

Investigate underlying causes

Apply fixes that address the real issue

Avoid “quick fixes” that mask problems

Trainingcred
Empower, Innovate, Advance.

Proactive Monitoring

Stopping Issues Before Users Notice

What Proactive Monitoring Involves

Regular performance reviews

Tracking KPIs and trends

Early warning through thresholds

Sample Monitoring Schedule

```
Daily:      Quick health check
Weekly:     Detailed analysis
Monthly:    Trend and workload review
Quarterly: Capacity and architecture planning
```

Trainingcred
Empower, Innovate, Advance.

Key Metrics

Database cache efficiency

CPU idle time and paging

Disk queues and latency

Application response times

Caution

Avoid tuning without measurable symptoms

Bottleneck Elimination Process

Reactive Performance Tuning

Used When: Users are already impacted

Process Flow

```
Identify Issue
↓
Collect Data
↓
Find Main Bottleneck
↓
Test Solution
↓
Deploy Fix
↓
Validate Results
```

Trainingcred
Empower, Innovate, Advance.

Possible Change Locations

Application Layer – SQL and logic changes

Database Layer – Indexes, parameters, storage

Infrastructure Layer – Hardware and network

SQL Tuning Essentials

Optimizing the Biggest Performance Driver

Why SQL Matters

Poor SQL stresses the entire system

Efficient SQL improves response times

SQL tuning often delivers the highest gains

OLTP vs. DSS Workloads

OLTP: Short, frequent transactions

DSS: Complex, long-running queries

OLTP favors indexes and fast response

DSS often relies on full scans and throughput

Trainingred
Empower, Innovate, Advance.

Oracle Query Optimizer

How Oracle Chooses Execution Plans

Optimizer Role

Determines the most efficient way to run SQL

Evaluates many execution alternatives

Minimizes overall resource usage

Optimizer Components

Query transformation

Cost estimation

Plan generation

Cost-based selection

Trainingcred
Empower, Innovate, Advance.

Statistics Required

Table and column data

Index characteristics

System CPU and I/O metrics

Execution Plans

How SQL Is Actually Executed

Execution Plan Definition

Step-by-step operations used to run SQL

Shows joins, access paths, and order

Generated by the optimizer

Viewing Execution Plans

```
EXPLAIN PLAN FOR
SELECT * FROM employees WHERE
department_id = 50;

SELECT * FROM
TABLE(DBMS_XPLAN.DISPLAY);
```

Trainigred
Empower, Innovate, Advance.

Common Operations

Full table scans

Index range scans

Nested loop joins

Hash joins

Sorting operations

Optimizer Hints

Influencing Execution Decisions

What Are Hints?

Optimizer suggestions embedded in SQL comments

Used only when necessary

Should not replace proper tuning

Examples

```
SELECT /*+ FULL(e) */ * FROM
employees e WHERE salary > 10000;
SELECT /*+ INDEX(emp emp_dept_idx) */
*
FROM employees emp WHERE
department_id = 50;
```

Trainingcred
Empower, Innovate, Advance.

When to Use Hints

Repeated suboptimal plans

Missing or unreliable statistics

Special performance scenarios

Oracle Performance Toolset

Getting Started with Monitoring

Required Setting

STATISTICS_LEVEL = TYPICAL (or ALL)

Enables performance data collection

Recommended Interface

Oracle Enterprise Manager Cloud Control

Unified monitoring and diagnostics

Visual dashboards and alerts

Alternative Access Methods

SQL*Plus and SQLcl

PL/SQL APIs

Dynamic performance views

Trainingcred
Empower, Innovate, Advance.

Automatic Tuning Features

Oracle's Self-Managing Capabilities

Automatic Workload Repository (AWR)
Foundation for performance diagnostics

Automatic Database Diagnostic Monitor (ADDM)
Identifies problems and suggests fixes

SQL Tuning Advisor
Optimizes individual SQL statements

SQL Access Advisor
Recommends indexes and materialized views

Trainingcred
Empower, Innovate, Advance.

Additional Automation Tools

Completing the Tuning Framework

End-to-end application tracing

Server-generated alerts

Memory advisors for SGA and PGA

MTTR, Segment, and Undo advisors

Trainingcred

Empower, Innovate, Advance.

V$ Performance Views

Real-Time Performance Data

Dynamic views backed by memory structures

Provide current system activity

Foundation for all Oracle tuning tools

Key Views

V$SESSION – Active sessions

V$SQL – SQL performance

V$SYSSTAT – System statistics

V$WAITSTAT – Wait analysis

V$LATCH – Latch contention

Note: AWR offers better historical insight

Trainingcred
Empower. Innovate. Advance.

Cloud Control Performance Page

Your Central Monitoring Console

Real-time and historical views

Automatic refresh

Top activity analysis

Host and instance metrics

Alerts and tuning recommendations

Custom dashboards for different roles

Trainingcred
Empower, Innovate, Advance.

Performance Tuning Best Practices

Guidelines for Reliable Results

Maintain accurate baselines

Follow a structured methodology

Address the biggest bottleneck first

Tune SQL before adding hardware

Use automation whenever possible

Trainingcred

Empower, Innovate, Advance.

Common Performance Mistakes

What to Avoid

Fixing symptoms instead of causes

Over-tuning without justification

Poor documentation

Skipping testing and validation

Trainingcred

Empower, Innovate, Advance.

Getting Started Checklist

Action Plan

Immediate

Verify statistics collection

Confirm AWR is active

Capture baselines

Short-Term

Schedule regular reviews

Enable alerts

Document configuration

Long-Term

Review capacity plans

Optimize critical SQL

Evaluate new Oracle features

Trainingcred
Empower, Innovate, Advance.

Key Takeaways

Performance Tuning Summary

Performance tuning is continuous

Understand the system before acting

Use Oracle’s built-in automation

Take a holistic view across layers

Collaborate across teams

Trainingcred

Empower, Innovate, Advance.

Additional Learning Resources

Oracle official documentation

Oracle University training

Community forums and blogs

User groups and technical articles

Trainingcred
